

Salt Time for Action in Hong Kong

Graham A MacGregor
Professor of Cardiovascular Medicine
Chairman of WASH

Wolfson Institute of Preventive Medicine,
Barts and The London School of Medicine & Dentistry,
Queen Mary University of London, UK

Major Underlying Factors causing Death - Worldwide

Raised BP is responsible for

- 62% of all Strokes
- 49% of all Heart Disease

Ezzati et al. Lancet 2002;360:1347-60.

Systolic BP and Risk of Death

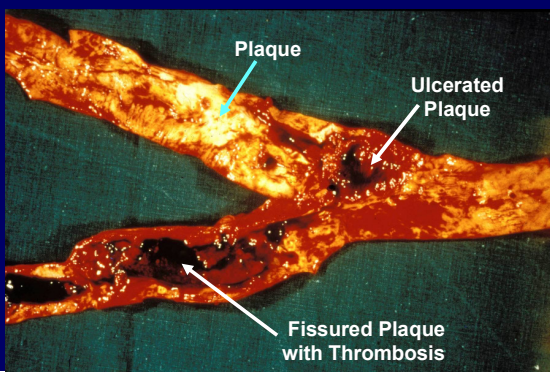

The risk starts at systolic 115 mmHg (83% adults)

MacMahon et al. Lancet 1990;335:765-74

Atheroma in carotid artery

What puts up population BP?

- Salt intake
- Lack of Fruit and vegetables
- Weight
- Lack of Exercise
- (Alcohol excess)

Salt

Up to 5000 yrs ago 0.1 g/d, now 9 to 12 g/d

Why?

- (a) Preserves food
- (b) Cleans up bad food

Now no need (a) Refrigeration
(b) Better chemicals

But eating 9 to 12 g/d - courtesy of the food industry

80% of salt hidden in food

- Processed
- Fast
- Restaurant
- Canteen

Salt, diet & health. 1998, Camb Uni Press

Totality of Evidence

- **Epidemiology** Over 50 population studies and Intersalt
- **Migration** e.g. Kenya
- **Intervention** Portuguese villages. New born babies
- **Genetic** All defects impair ability of the kidney to excrete Na
- **Mechanisms** Plasma Na, corrected volume expansion
- **Animal** BP caused or aggravated by salt (e.g. chimpanzees)
- **Treatment** Meta-analysis. Dose response
- **Mortality studies** Meta-analysis of cohort studies
- **Outcome trials** Meta-analysis of outcome trials

Meta-analysis of ↓ Salt Intake by 5-6 g/day

↓ Stroke 24% ↓ CHD 18%

UK ≈35,000 deaths prevented per year

Worldwide ≈ 2.5 million deaths prevented per year

Ho & MacGregor. Hypertension 2003;42:1093-99

Meta-analysis of Outcome Trials (Lancet 2011)

↓ Salt 2 g/d
↓ CVD events 20% (P<0.05)

Study	Reduced-salt Events/Total	Control Events/Total	Relative risk (95% CI)	Relative risk of CVD events (95% CI)
TOSPI	77/521	92/511	0.61 (0.28, 0.91)	
TOSPI II	71/694	85/700	0.66 (0.05, 1.20)	
Morgan	6/54	8/33	1.98 (0.36, 3.66)	
TOSPI	38/250	48/301	0.80 (0.57, 1.01)	
Total	199/1918	183/1910	0.86 (0.84, 0.88)	

Heterogeneity: $I^2=0.00$, $df=3$ ($P=0.97$), $I^2=0%$
Test for overall effect: $Z=2.02$ ($P=0.04$)

Forest plot showing relative risk of CVD events. The plot shows a diamond for the total effect at 0.86 (95% CI 0.84, 0.88) and individual study squares. The x-axis represents relative risk, with 1.0 as the null effect. Values to the left of 1.0 indicate a protective effect (reduced salt), and values to the right indicate no effect or harm. The plot is labeled 'Pretense reduced salt' on the left and 'Pretense control' on the right.

Ho & MacGregor. Lancet 2011;378:380-387

Summary

Salt intake (9–12 g/day)

- Population BP, rise in BP with age, hypertension
- Other effects e.g. stomach cancer, stroke, LVH, kidney disease, osteoporosis etc

∴ Reduce salt intake
from 9–12 g/day to 5 g/day

How to ↓ Salt Intake

Measure amount and sources of salt

Added
Cooking/Table Sauces
↓
Public health campaign

Food industry
Processed food
Eating out
↓
Gradual reduction in added salt

Campbell, et al. JHH. 2011

Reducing salt intake Who is responsible?

- Public
- Government
- Food industry

Developed countries 80% salt passive

∴ Food industry is responsible & must take it out

How ?

- Slowly 10-30% per year
- No taste problems
- Almost no technical problems
- Voluntary but threat of legislation
- Clear labelling

Hidden Salt in food

e.g. processed, fast, takeaway, restaurant food

Food industry slowly reduce
- No rejection by public

Fantastic for Public Health

Very little
cost

↓ BP

No need to
change diet

CASH Strategy for Reducing Salt in UK

Source	Salt intake g/day	Reduction needed	Target intake g/day
Table/Cooking (15%)	1.4 g	40% reduction	0.9 g
Natural (5%)	0.5 g	No reduction	0.5 g
Food industry (80%)	7.6 g	40% reduction	4.6 g
Total 9.5 g			Target 6.0 g

∴ The food industry needs to slowly reduce salt content of all foods by 40% over the next 5 years by setting target for each food category

www.actiononsalt.org.uk

Targets set in UK by FSA & CASH

- Set targets for industry to achieve from 2005 to 2010. New targets set for 2012 over 80 categories of food
- Gradual reduction, 10-20% a year. No rejection by public
- Continuous media publicity to ensure industry collaborate
- Praise companies achieving targets, name and shame those not

Monitor salt intake

- Measure 24h urinary sodium in a random sample of the population every 3 years
- Monitor reductions in the amount of salt added to foods by the food industry & ensure they will reach the target that has been set for each food group

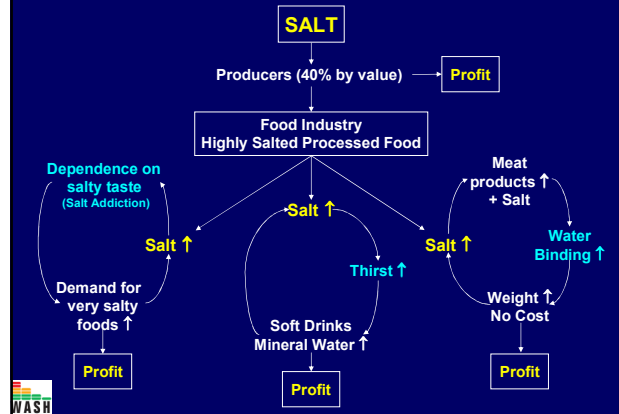

Perceived Barriers

1. Taste
2. Food technology
3. Safety
4. Commercial

Hidden Salt – Its Commercial Value

Sea Water Comparison

(1.0 g of sodium / 2.5g of salt per 100g)

Pizza	60%	Meat Sliced White	50%
Chicken Curry	60%	Granary Loaf	60%
Processed Cheese	130%	Crumpets	80%
Bacon	200%	Digestive	60%
Sausages	100%	Cream Crackers	60%
Smoked Fish	190%	Cheddar Cheese	70%
Sweet Pickle	170%	Stilton Cheese	90%
Shepherds Pie	40%	Processed Cheese	130%
Frozen Prawns	80%	Branflakes	100%
Crisps	110%	Cornflakes	110%
Salad Cream	100%	Tomato Ketchup	110%
Savoury Biscuits	70%	Brown Sauce	100%

Above data collected 2001, n.b. most have been reduced by 10 – 30% (2008) UK only

Salt reduction targets

Main Product Category (Sub Categories where relevant)	Current 2010 Targets (g salt or eq sodium per 100g)	Targets for 2012 (g salt or eq sodium per 100g)	Comments	
7. Baked Beans	2.1 Baked beans in tomato sauce without accompaniments	0.8g salt or 20mg sodium (minimum)	0.63g salt or 16mg sodium (minimum)	The Agency recognises the significant reductions that have already been achieved in these products and the difficulties with achieving the 2012 target with the literature set. We will therefore review progress in both 2011 and 2012.
8. Ready meals and meal centres	8.1 Chinese/Thai/Indian – ready meals Includes all Chinese, Thai and Indian ready meals with accompanying soups, rice, noodles etc made from fresh produce, but no rehydrated e.g. fried and sou chicken with rice, that have significant sodium contents.	0.8g salt or 20mg sodium (average) 1.13g salt or 28mg sodium (maximum)	0.63g salt or 16mg sodium (average) 1.13g salt or 28mg sodium (maximum)	The revised category also now includes all cooked poultry products, as well as cooked fish products, and all non-meat pies (e.g. cheese and onion pies). Some vegetarian products based on meat analogue products e.g. Quorn, Tostitos etc are included in category 25, although meat content and ready meal content in category 8. We recognise that some manufacturers will have a small range of products that do not have high in sodium for example frozen bread (on cheese and poultry). In these applications the Agency cannot control sodium levels.
9. Soups	9.1 Bread soups (see comment 8) Includes all soups in a cup and other dried soups as consumed, i.e. once rehydrated.	0.8g salt or 20mg sodium (average) 0.73g salt or 18mg sodium (minimum)	0.63g salt or 16mg sodium (average) 0.73g salt or 18mg sodium (minimum)	It is proposed that just one target is set for soups. This would continue to apply to meat soups or non-meat soups as appropriate to manufacturer instructions). The Agency is aware that a number of manufacturers are testing the feasibility of the target for dried soups and soups cooked in 2009.
10. Pizzas	10.1 Pizzas with higher salt toppings e.g. cooked meat (ham, bacon, salami), chorizo, salt beef, olives, anchovies and cooked fish, yeast cheese, prawns, prosciutto, onion, tuna and "cheese crust" (see comment 8)	1.2g salt or 30mg sodium (average) 1.25g salt or 31mg sodium (maximum)	1.0g salt or 25mg sodium (average) 1.25g salt or 31mg sodium (maximum)	
11. Crisps and snacks	11.1 Standard potato crisps All standard potato crisps, all flavours except salt and vinegar. Includes	1.5g salt or 38mg sodium (maximum)	1.3g salt or 33mg sodium (maximum)	The Agency recognises that this snack sector has achieved a considerable amount of salt from their products and has been reviewing the feasibility of a target for this sector. The Agency is aware that a number of manufacturers are testing the feasibility of the target for dried soups and soups cooked in 2009.
12. Bread	12.1 Sandwiches	1.5g salt or 38mg sodium (maximum)	1.3g salt or 33mg sodium (maximum)	The Agency recognises that this snack sector has achieved a considerable amount of salt from their products and has been reviewing the feasibility of a target for this sector. The Agency is aware that a number of manufacturers are testing the feasibility of the target for dried soups and soups cooked in 2009.
13. Table Salts	13.1 Table salt	2.0g salt or 50mg sodium (maximum)	1.8g salt or 45mg sodium (maximum)	

A level playing field - all companies work to the same salt target

Voluntary

- Quicker
- Continuous media pressure
- Acceptable to government
- Big reduction - difficult

Regulation/legislation

- Slower
- No need for media pressure
- Party in power may change
- Big reduction - possible

Food industry needs "level playing field"

The voluntary 'carrot and stick' approach

www.actiononsalt.org.uk

HIDDEN SALT KILLING 40,000 A YEAR

Scientists prove that salty diet costs lives

15-year study shows link to heart disease

Calls grow louder for nationwide campaign

High blood pressure

Using low salt reduces the chances of having a heart attack or stroke, the first researchers study of salt's effect on health remains solid.

The findings, from a 15-year study, offer the strongest evidence yet that cutting salt consumption could lower the risk of heart disease and stroke.

The study, published in the British Medical Journal, underpins the need for a nationwide salt reduction campaign in the diet, the scientists conclude.

Salt gives 4-year-olds high blood pressure

CHILDREN as young as four are getting high blood pressure because of the salt in their diet, researchers have found.

Researchers from the University of Bristol, UK, found that 10% of four-year-olds had high blood pressure, which is a sign of heart disease.

The study, published in the British Medical Journal, underpins the need for a nationwide salt reduction campaign in the diet, the scientists conclude.

The hidden salt that could ruin your child's life

HOW A SINGLE MEAL CAN CHANGE THE SALTY SALT

SALT SHAKER

Some High Street salads are saltier than a Big Mac

by Amanda Cable

Is your lunchtime salad less healthy than a Big Mac or a Mars Bar?

PUGH

TAKEAWAY LUNCHES

SALT MAY CONTAIN TRACES OF SALAD

READY MEAL ROASTS TOO SALTY

They're same as 20 bags of crisps

THE SALAD AS SALTY AS 7 BAGS OF CRISPS

Restaurant meals have danger level

SALT SHAKER

Restaurant meals have danger level

Jamie Oliver feels the heat over salt levels in meatballs

Slash salt 'to prevent thousands of deaths'

HOSPITAL FOOD IS A SALT SHAKER

at fatty kids' meals

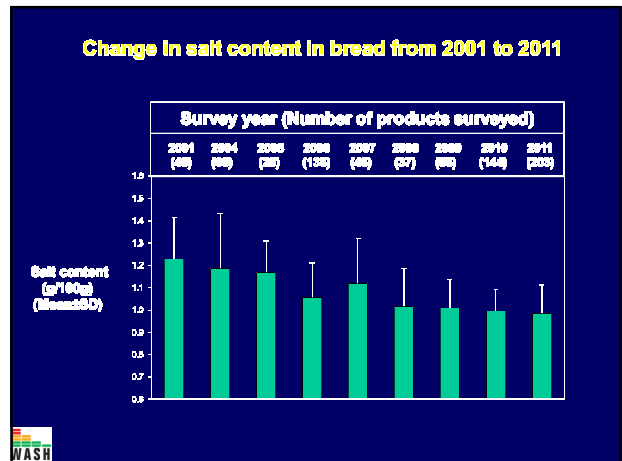

that's as salty as a Big Mac

Post-jamie the junk food danger that still marks at school gates

SHOPS' BREAD SALTY THAN CRISPS

SALT KIDS' KILLER MEALS

WASH

UK Success by 2011

Salt intake has been reduced **from 9.5 to 8.1 g/d salt (15% ↓)**
 (24-hour urinary sodium)
 but target of 6 g/d still to be achieved
 i.e. 49,000 tons/yr salt removed

So far ≈18000 strokes & heart attacks prevented per year (9,000 fatal)

WASH www.actiononsalt.org.uk

Cost-effective Analysis UK (NICE)

Cost of salt campaign ≈£5 million per year
 Healthcare savings ≈ £1.5 billion per year

WASH <http://guidance.nice.org.uk/PH25>

WASH Action Groups

Worldwide Action

1. USA, Canada, Australia following UK model
2. Europe (ESAN) 16% reduction over 4 yrs
3. PAHO: Brazil sets targets, Chile, Argentina, Mexico following
4. Asian-Pacific: Salt intake is very high, e.g. China, Japan, Korea. Urgent need to reduce salt

Global Food Industry could play a much more prominent role

- Unilever & Pepsico worldwide salt reduction across their products
- Kellogg's, Nestle about to reduce salt globally to UK levels

South Africa

- Has set target of 5 g/d salt by 2025
- Minister of Health can regulate food supply
- 29 out of 30 major global food companies opted for a regulatory approach as it gave them a guarantee of a level playing field
- Salt targets set for 10 biggest contributors

Sources of salt in Hong Kong

Hong Kong

- Salt intake: ≈ 12 g/d (high) measured by 24h urinary sodium
- Major sources of salt $\left\{ \begin{array}{l} \text{Processed food?} \\ \text{Eating out} \end{array} \right.$
- Set target for biggest contributors
- Monitor progress
- For voluntary policy – strong government support & forceful NGOs essential

Conclusion

Every country in the world must now

1. Set up salt reduction plan
2. Implement the plan

This is the single most cost-effective public health measure

It would be negligent for any government not to take action now
